

DAN Homework

For this week's homework, please unzip the file HW2 on the website. Your job is to implement word dropout (section 3.1 in the DAN paper) in the models.py file.

You will need to have Pytorch installed, within a virtual environment in the homework folder or however else you manage dependencies. To run your model and get a printed result, please run this command in the root directory of your homework folder: `python neural_sentiment_classifier.py --model DAN`

Finally, please include the following in your submission:

1. Your completed models.py file
2. A brief writeup of what you did, and improved results

Good luck :)
